

# Application Health Check

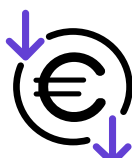

As applications grow, speed can outpace governance, creating anti-patterns that impact business results through slower performance, higher maintenance effort, and delayed delivery. The Application Health Check is a focused review of your OutSystems apps that assesses code quality and architecture against best practices, with clear actions to improve performance, scalability, and maintainability.

## What this service gives you:

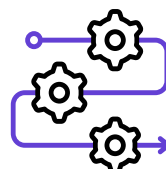

### Reduce operational risk

Protect business stability by addressing architectural gaps, code quality issues, and security exposures before they escalate.

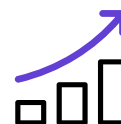

### Lower technical debt

Minimize rework and hidden costs by improving maintainability, enabling applications to adapt and scale with business needs

### Simplified application landscape

Reduce portfolio complexity to support more predictable releases, easier governance, and smoother operations.

### Increase ROI on low-code investments

Ensure your OutSystems platform is used efficiently, following best practices that drive long-term value and scalability.

Want to know how healthy your OutSystems applications really are? With our **Application Health Check**, we review your apps against OutSystems best practices for performance, security, architecture, and maintainability.
