

# OutSystems AI Use-Case Workshop

Less than 10% of AI use cases ever reach production. Many organizations start too late or choose the wrong use cases. In this workshop, we combine AI and OutSystems expertise with a practical analysis of your processes. The result: no theoretical lists, but real, concrete AI agents you can quickly build on the platform you already use.

## What this workshop gives you:

### Explore all AI possibilities

We analyze your workflows and identify where Agentic AI can immediately add value: time-consuming processes, error-prone tasks, and manual work that can be automated.

### Discover the best use cases

We assess each opportunity for value, risk, and feasibility within OutSystems. The result: a clear priority list of 3-5 use cases that deliver the highest impact.

### Insight into impact and investment

For each use case, you'll see what it delivers. Time saved, cost reduction, quality improvements, and what it takes to build it. Clear numbers that support confident decision-making.

### A plan to move forward

The winning use case is worked out in detail: what the AI agent does, which data it uses, how it integrates into OutSystems, and a roadmap to actually build and roll it out.

### Want to get started quickly?

For the first three OutSystems organizations, this workshop is completely free. Move from AI ideas to concrete use cases in a single session. For more information visit:
